

## Estimation of the Unsteady Aerodynamic Load on Space Shuttle External Tank Protuberances from a Component Wind Tunnel Test

Filesize: 1.18 MB

### ***Reviews***

*An incredibly great book with perfect and lucid reasons. It really is written in straightforward words instead of confusing. I am just very easily could get a delight of reading through a written pdf.*  
*(Curt Bogan)*

## ESTIMATION OF THE UNSTEADY AERODYNAMIC LOAD ON SPACE SHUTTLE EXTERNAL TANK PROTUBERANCES FROM A COMPONENT WIND TUNNEL TEST

To get **Estimation of the Unsteady Aerodynamic Load on Space Shuttle External Tank Protuberances from a Component Wind Tunnel Test** eBook, remember to follow the hyperlink under and save the document or have access to other information which are highly relevant to ESTIMATION OF THE UNSTEADY AERODYNAMIC LOAD ON SPACE SHUTTLE EXTERNAL TANK PROTUBERANCES FROM A COMPONENT WIND TUNNEL TEST ebook.

Bibliogov, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.At the wake of the Columbia (STS-107) accident it was decided to remove the Protuberance Aerodynamic Load (PAL) Ramp that was originally intended to protect various protuberances outside of the Space Shuttle External Tank from high buffet load induced by cross-flows at transonic speed. In order to establish the buffet load without the PAL ramp, a wind tunnel test was conducted where segments of the protuberances were instrumented with dynamic pressure transducers; and power-spectra of sectional lift and drag forces at various span-wise locations between two adjacent support brackets were measured under different cross flow angles, Mach number and other conditions. Additionally, frequency-dependent spatial correlations between the sectional forces were also established. The sectional forces were then adjusted by the correlation length to establish span-averaged spectra of normal and lateral forces that can be suitably added to various other unsteady forces encountered by the protuberance. This paper describes the methodology used for calculating the correlation-adjusted power spectrum of the buffet load. A second part of the paper describes wind-tunnel results on the difference in the buffet load on the protuberances with and without the PAL ramp. In general when the ramp height is the same as that of the protuberance height, such as that found on the liquid Oxygen part of the tank, the ramp is found to cause significant reduction of the unsteady aerodynamic load. However, on the liquid Hydrogen part of the tank, where the Oxygen feed-line is far larger in diameter than the height of the PAL ramp, little protection is found to be available to all but the Cable Tray.
